

## ABSTRACT OF THE DISCLOSURE

A segregated container for holding multiple substances including an outer container, and inner container, a sealing member, and a sealing cap. The inner container is at least partially slidably received within the outer container. The sealing member is releasably secured to an upper rim of the inner container so as to define a closed space within the inner container. The sealing cap is sealingly secured to the outer container circular rim so as to secure the inner container within the outer container. The inner and outer containers may each contain a substance, solid or liquid, that is isolated from the other during shipment and storage, and which may be separately accessed for use.
